# Predicting Climatic Extremes impact to support Anticipatory Action

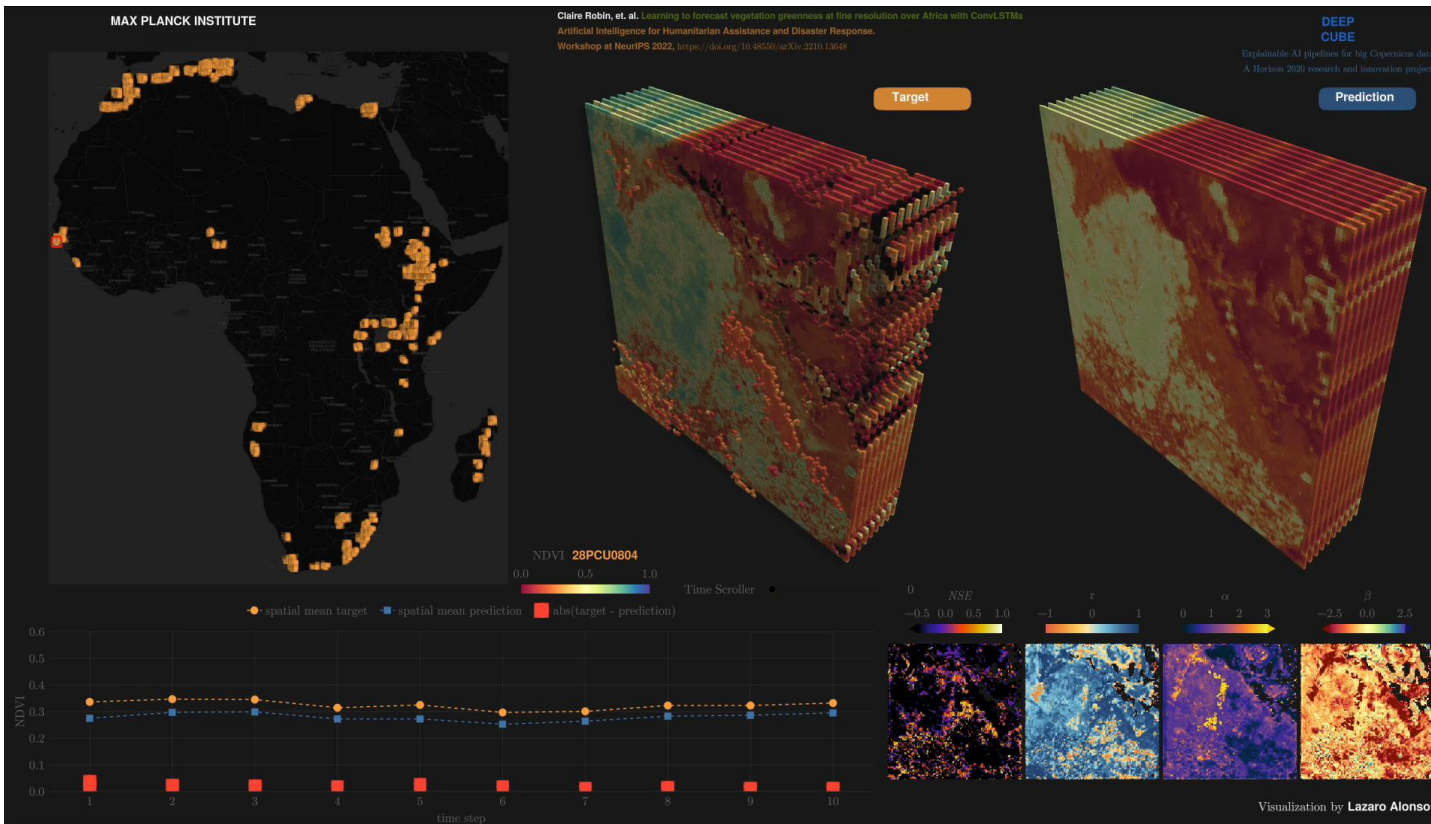

# The EarthNet Modeling Framework

**Objective:** Predict the impact of climate extremes on vegetation using ML method.

# Vegetation Forecasting Prediction with a ConvLSTM

# EarthNet - Datasets

## EarthNet2021

- First Dataset
- 25k Minicubes
- Europe
- Naïve Baselines

[Requena, 2021]

## GreenEarthNet

- EarthNet2021 Version 2
- Improved Cloud Mask
- More Test sets
- Climatology Baseline

[Benson, 2024]

## EarthNet2022

- 50k Minicubes
- Africa
- Focus on Droughts
- ConvLSTM Model (SOTA)

[Robin, 2022]

## “DeepExtremeCubes”

- 50k Minicubes
- Global
- Compound Events:  
Droughts + Heatwaves

The figure consists of two parts. The top part is a map of the Balkan region, showing countries like Albania, Serbia, Kosovo, and Macedonia. A red dot is placed in Kosovo, with a label 'KOSOV' and a red arrow pointing to it. The bottom part is a large satellite image of a mountainous region, likely the area around Pristina. An orange box highlights a specific area in the center of the image, which is the focus of the study.

Results in progress

RGB Components on Earth Map

## Climatic extremes do not necessary lead to a strong vegetation response

**Climatic extremes such as drought elicit different vegetation responses**

## Regional Extremes

- **Climatic extremes are defined over a long time period (30 years) using local percentage threshold.**
- **Environmental variables are limited in time:**
  - 24 years for Modis.
  - **8 years of Sentinel-2.**
- **Regional Extremes define extremes using regions of similar phenology**
  - Avoid uniform distribution of extremes.

## 2- Process

### Data:

#### PEI

- Removed ocean and polar area.
- Between 1970 - 2022.
- Compute the mean seasonal cycle.
- Normalize the data

#### Model:

- PCA with 3 Components
- Train on a subset of 10000 samples (on lands).
- Applied to the full dataset.
- Compute the limits of the bins.
- Attribute a bin for each sample.

3D PCA Projection with RGB Colors

# Climatic Extremes: PEI - Mean Seasonal Cycle

**PEI:** daily differences of Precipitation and Evapotranspiration averaged over 30, 90, and 180 days (PEI30, PEI90, PEI180).

[Weynants, 2024] Mélanie Weynants, Chaonan Ji, Nora Linscheid, Ulrich Weber, and Fabian Gans. A global database of hot and dry extreme events from 1950 to 2022. In Prep.
