# Tabular data?

Example: Which patients have early-stage Alzheimer (based on omics blood markers)?

ID	L-Car-nitin	Crea-tinin	Homocys-tein	Beta-hydro-xybutyrat	Early-stage Alzheimer
1	45.2	85	12.1	0.4	Yes
2	38.7	72	10.5	0.3	No
3	41.0	90	13.2	0.2	Yes
4	36.5	80	9.4	0.5	No
5	44.8	78	12.0	0.6	Yes
6	39.3	88	11.1	0.4	No
7	42.1	76	13.0	0.7	Yes
8	37.5	70	8.9	0.3	No
9	40.9	92	14.1	0.5	Yes
10	36.0	75	10.2	0.4	No
⋮	⋮	⋮	⋮	⋮	⋮
5000	43.0	84	12.7	0.6	Yes
5001	41.2	81	11.5	0.4	?
5002	43.5	83	11.8	0.5	?
5003	39.9	74	10.0	0.3	?

Tabular  
prediction  
problem

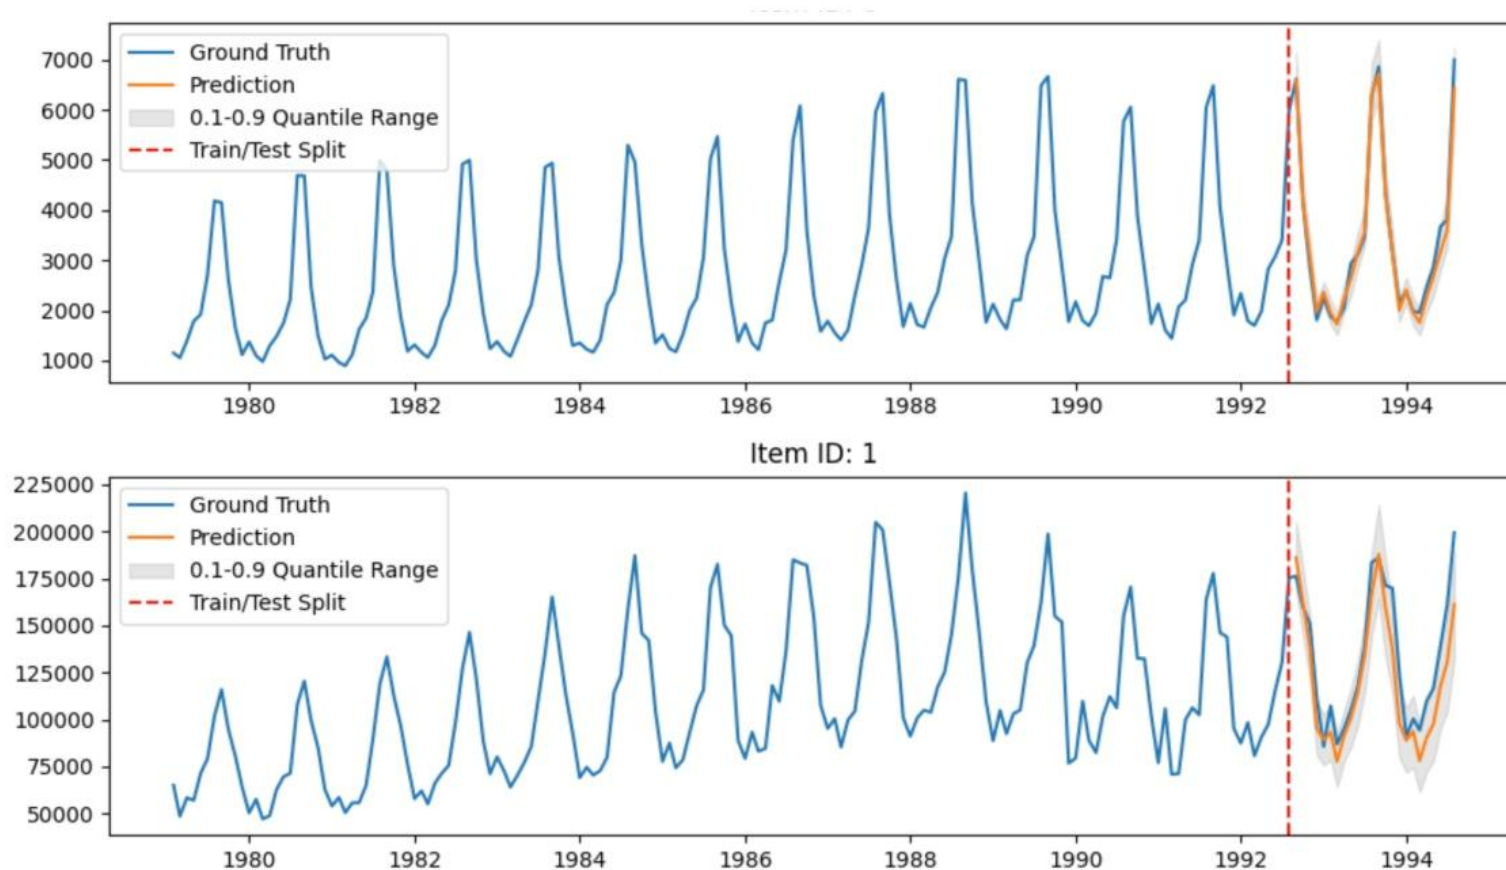

## Personalized health models

- „Omics“-bloodmarkers instead of invasive diagnostics
- Better tabular models multiply value of \$BN data acquisition efforts

# Why tabular data?

	Healthcare		Finance		Business Analytics		Insurance	
Classification / Regression	Personalized Risk Prediction	Drug response prediction	Loan default prediction	Fraud detection	Customer Lifetime Value Prediction	Customer segmentation	Premium price prediction	Fraud detection
	Medical billing fraud detection	Sepsis detection	Credit risk assessment	AML & transaction monitoring	Pricing optimization	Resource allocation	Claim & loss prediction	Customer segmentation
Time Series	AI-Enhanced Intensive Care	Hospital readmission prediction	Trading price prediction	Currency exchange rates	Metric forecasting	Sales & inventory forecasting	Climate risk modeling	Care cost forecasting
Recommendation Systems	Clinical Decision Support	Clinical Trial Matching	Investment products	Personalized banking	Cross selling	Product recommender	Preventative measures	Contract recommendation

# Why tabular data? Very related: Time Series Forecasting

How will XYZ develop over time?

- Stock prices
- Energy price
- Supply & demand
- Temperature
- Traffic congestion
- Machine health
- ...

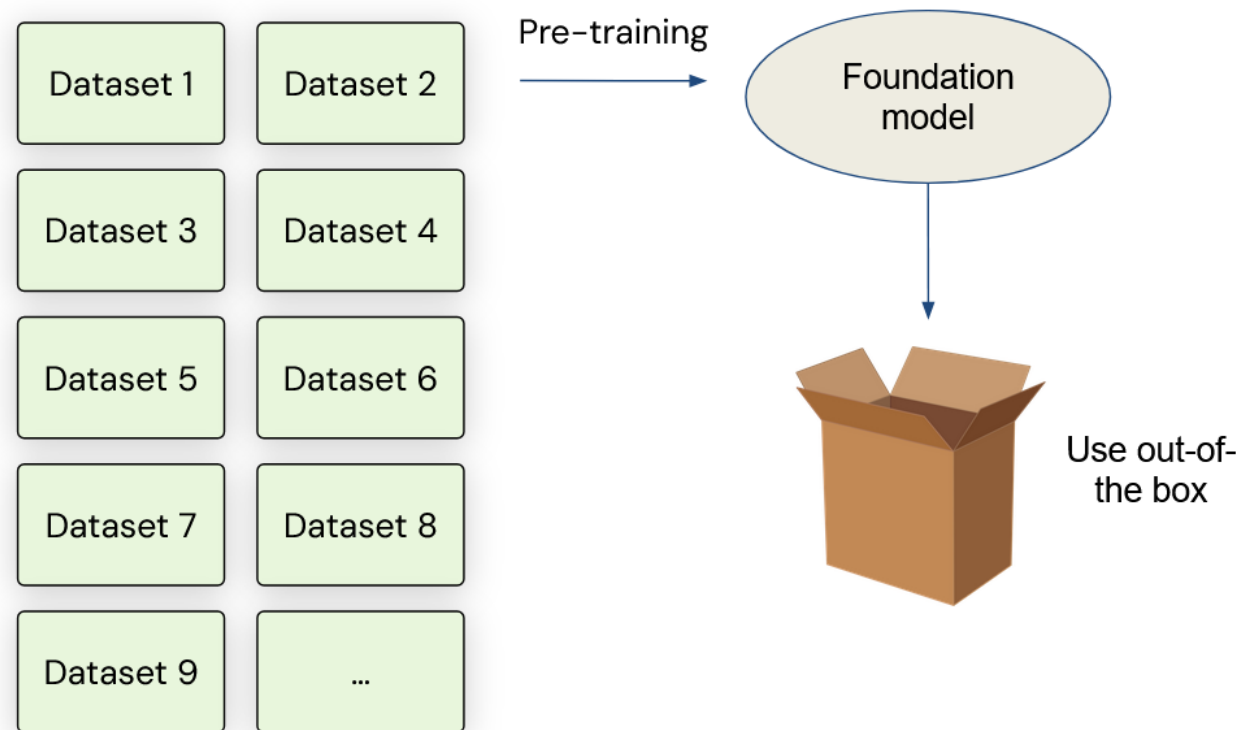

# Why Foundation Models for Tabular Data?

## Traditional ML

- Individual siloed models
- Lengthy task-specific training

## Foundation models

- Off-the-shelf use without retraining
- Can quickly be finetuned to new use cases

## Foundation models have transformed text & images

**But our most valuable data is organized in tables**

- Motivation for Tabular Foundation Models

## TabPFN

- TabPFN v2
- TabPFN for time series: TabPFN-TS
- Explainability & Fairness

# TabPFN: a Learned Algorithm for Small Tabular Data

- TabPFN is a **GPT-like transformer for tabular classification**
- Framed as next-word prediction:  $x_1, y_1, \dots, x_n, y_n, x_{n+1}, ?$

- To be more precise:

- To be even more precise:

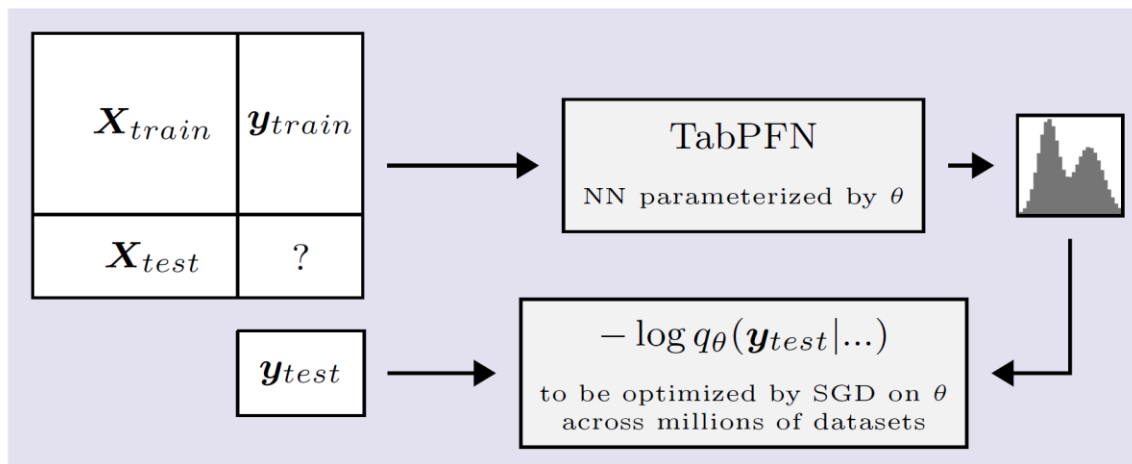

# The high-level intuition

- TabPFN is a transformer with weights  $\theta$ 
  - A single forward pass directly approximates  $p(\mathbf{y}_{n+1} \mid \mathbf{x}_{n+1}, \{(\mathbf{x}_1, \mathbf{y}_1), \dots, (\mathbf{x}_n, \mathbf{y}_n)\})$
- We optimize  $\theta$  to minimize average cross entropy loss across datasets
  - Across which datasets?
    - Millions of synthetically generated ones:  $\{(\mathbf{x}_1, \mathbf{y}_1), \dots, (\mathbf{x}_{n+1}, \mathbf{y}_{n+1})\}$
  - How do we train it?
    - Very standard transformer architecture (just drop the positional encoding)
    - Standard supervised learning with SGD

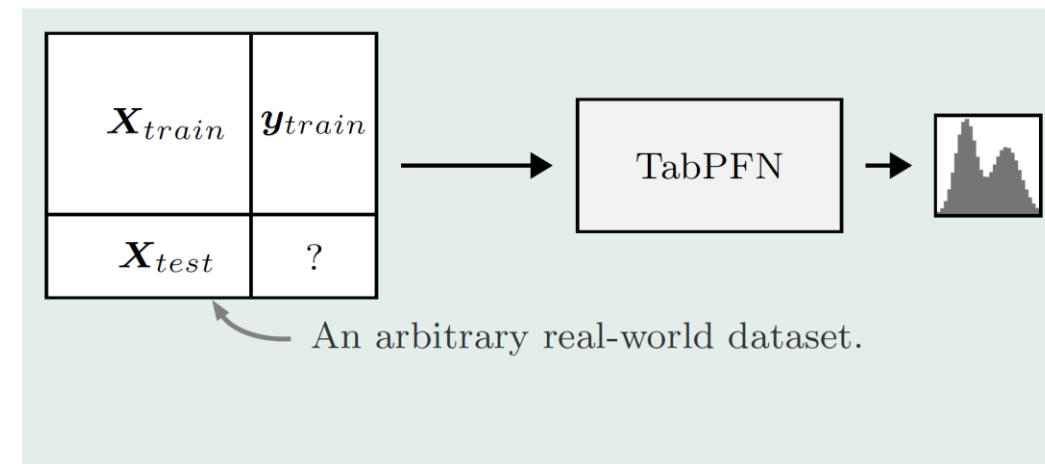

# TabPFN High-Level Overview of Training & Inference

TabPFN is trained on synthetic data to take entire datasets as inputs and predict in a forward pass

TabPFN can now be applied to arbitrary unseen real-world datasets

The only missing piece: a method to **generate synthetic data sets** that resemble the data sets we expect (TabPFN then approximates the Bayesian posterior for the prior we define over these datasets)

# TabPFN Prior: Integrating Principles from Causality

Sample & initialize  
a causal graph

Build dataset:

output > 0.2?

1

0

0

$\{((.33, .35), .35),$

$((.22, .08), .05),$

$((0., 1.1), 0.)\}$

Sample noise  
per example  
& forward pass

# TabPFN Prior: Simplicity Principle

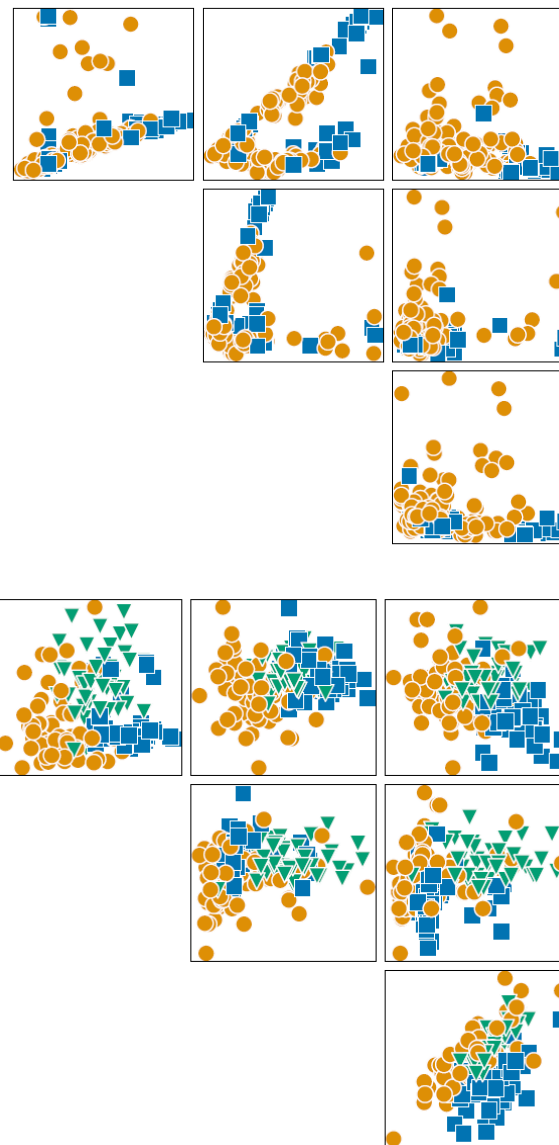

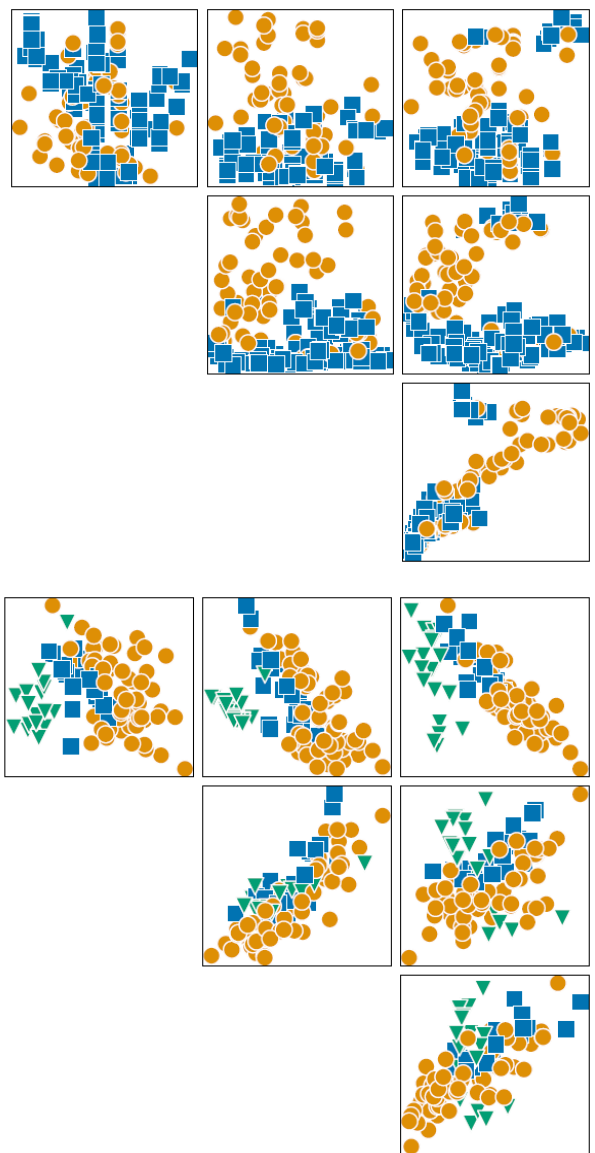

Prior likelihood

Graph Complexity

# The generated datasets look similar to real datasets

Synthetic  
datasets

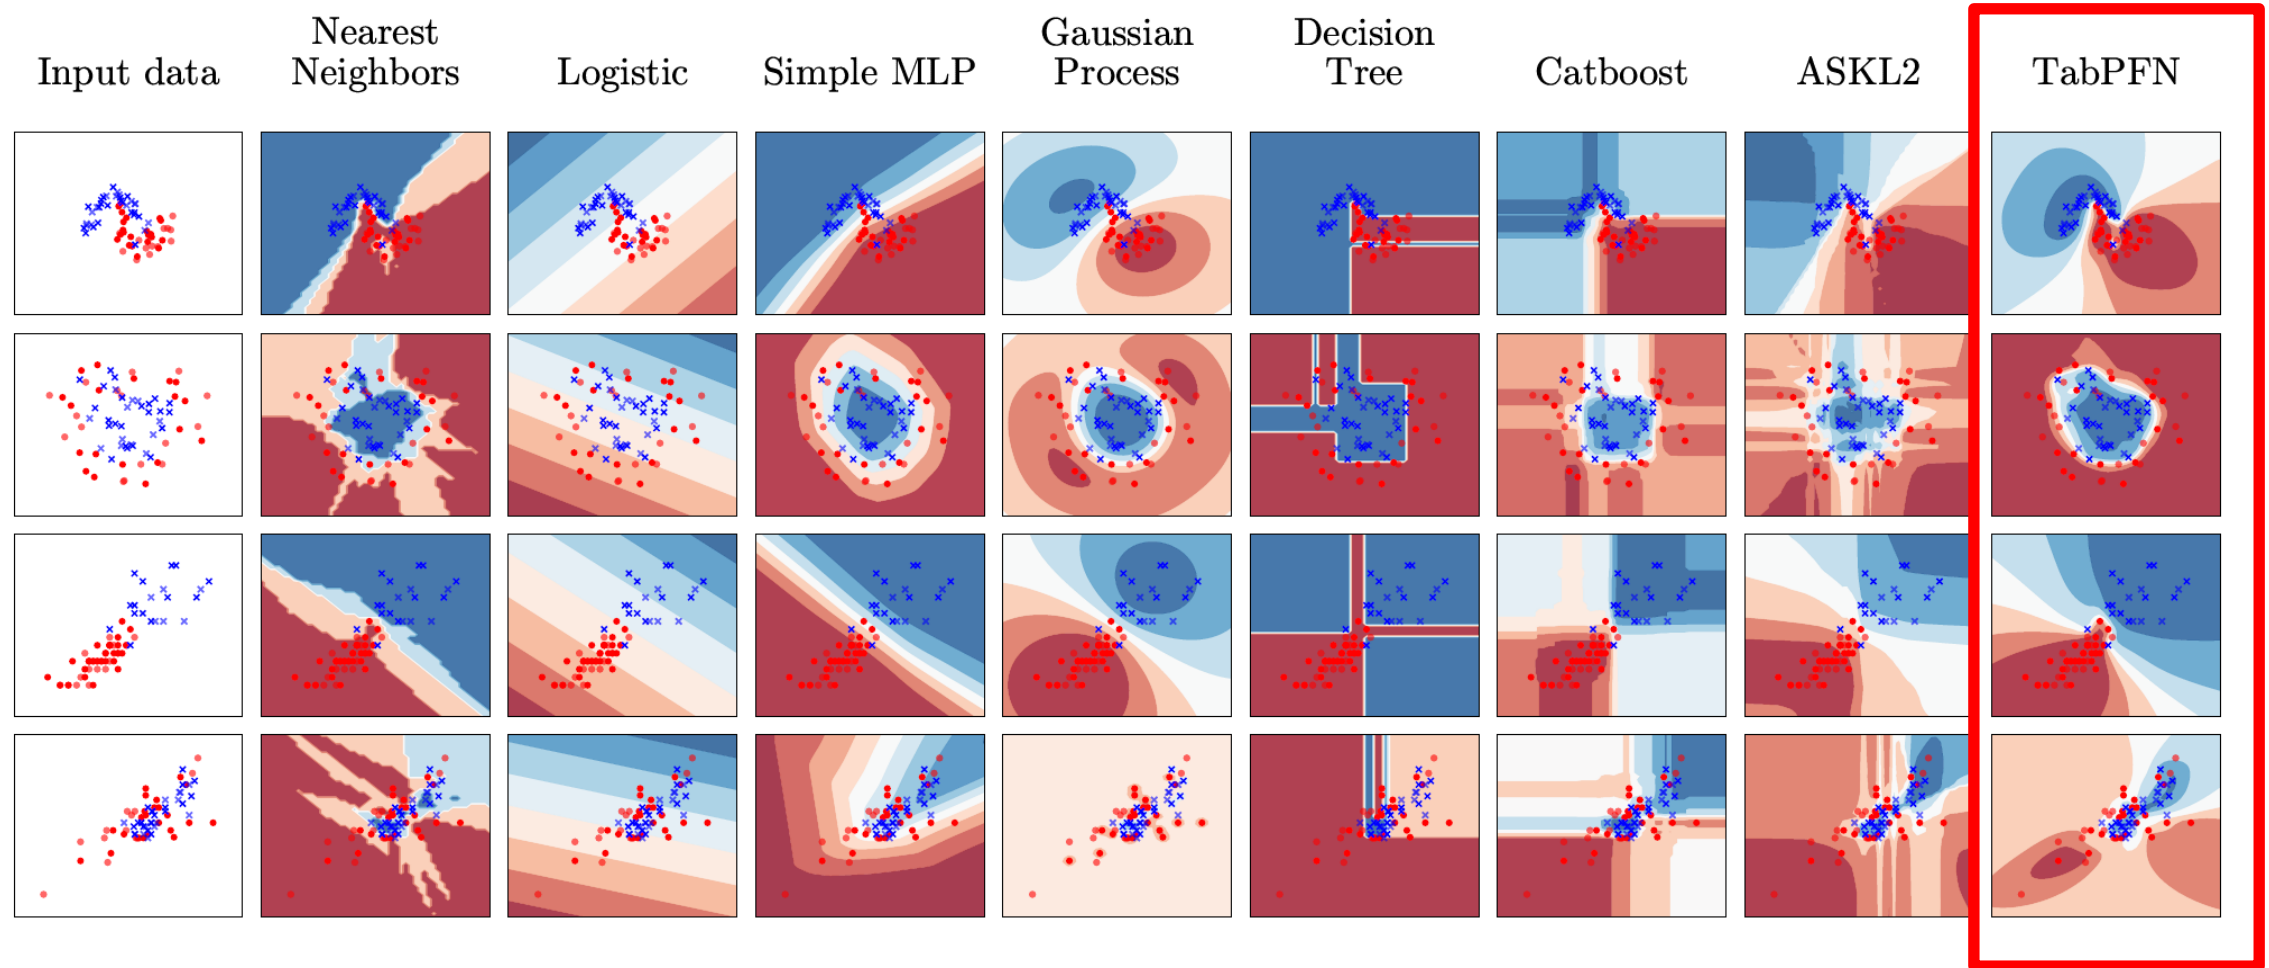

Parkinsons  
dataset

Wine  
dataset

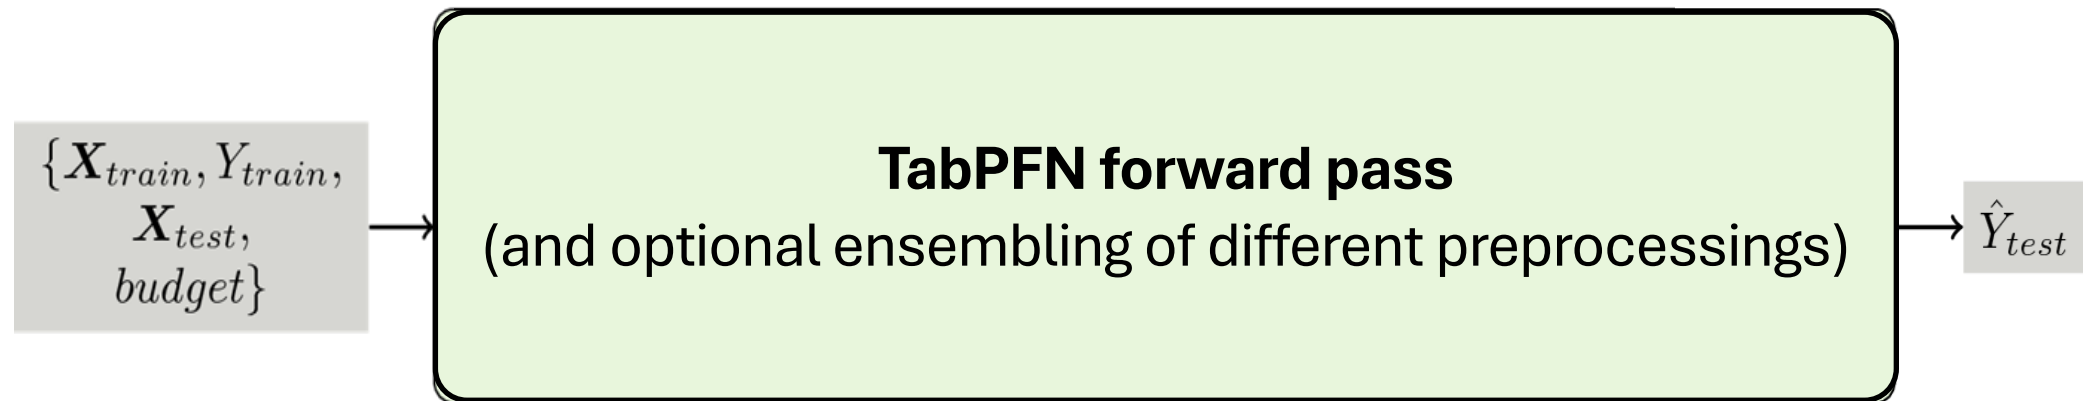

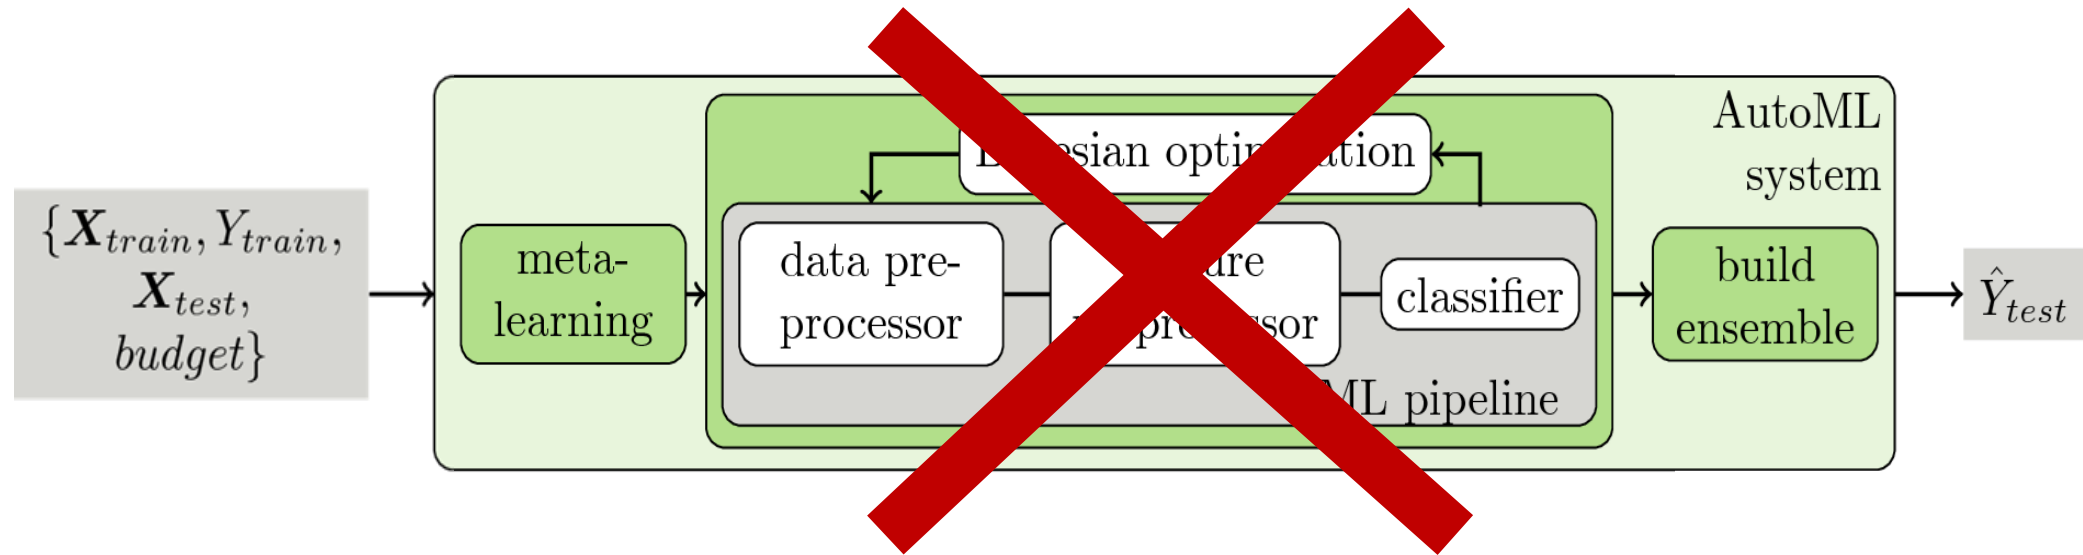

# Qualitative result: smooth & well-calibrated predictions

Learning on synthetic datasets yields strong performance on new datasets

# Simplicity: it's just a forward pass

# Quantitative Result (87 numerical datasets, no missing values)

- **Better performance in 1s than than any other ML / AutoML method in 1h**
  - Disclaimer: these are average results; TabPFN is not the best on every single dataset

- **Limitations** (in 2022)
  - Size: up to 1000 data points, 100 features, 10 classes
  - Not (yet) designed for: categorical features, missing values, uninformative features
  - Only classification
  - High inference time

- Motivation
- TabPFN
- ➔ TabPFN v2
  - TabPFN for time series: TabPFN-TS
  - Explainability & Fairness

# Improvements since TabPFN v1

- Now best tabular ML algorithm for  $\leq 10000$  data points, 500 features
  - Better in 5 seconds than any other method in 4 hours
- **Limitations resolved**
  - Size: up to ~~1000~~ 10000 data points, ~~100~~ 500 features, 10 classes
  - ~~Not (yet)~~ Now also designed for: categorical features, missing values, uninformative features
  - Classification & regression
  - ~~High~~ Moderate inference time

- **Scaling up**
  - More efficient attention to support more data points
  - Change in architecture to support arbitrary #features
  - Inference speedups
- **Improving the prior**
  - Trees in the structural causal models
  - Supporting more activation functions (sine, log, exponentials, ..)
  - Discretizing categoricals in the prior already
  - A lot of engineering ...
- **Demonstrating foundation model capabilities**

# New TabPFN v2 Architecture

## TabPFN Architecture

2-D TabPFN Layer (12x)

Predictions:  $\hat{y}_{test}$

Input dataset

$x_1$   $x_2$   $y$

1.2	6.1	3.
8.9	9.1	3.1
1.0	2.9	6.7
33.3	2.2	?

We predict this entry.

1-D Feature Attention

1-D Sample Attention

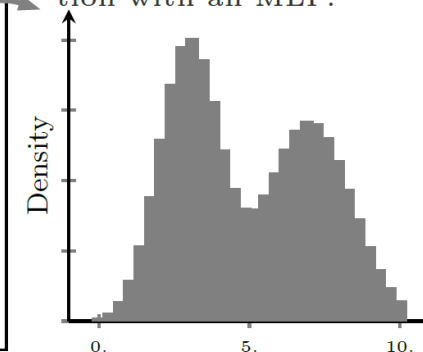

MLP

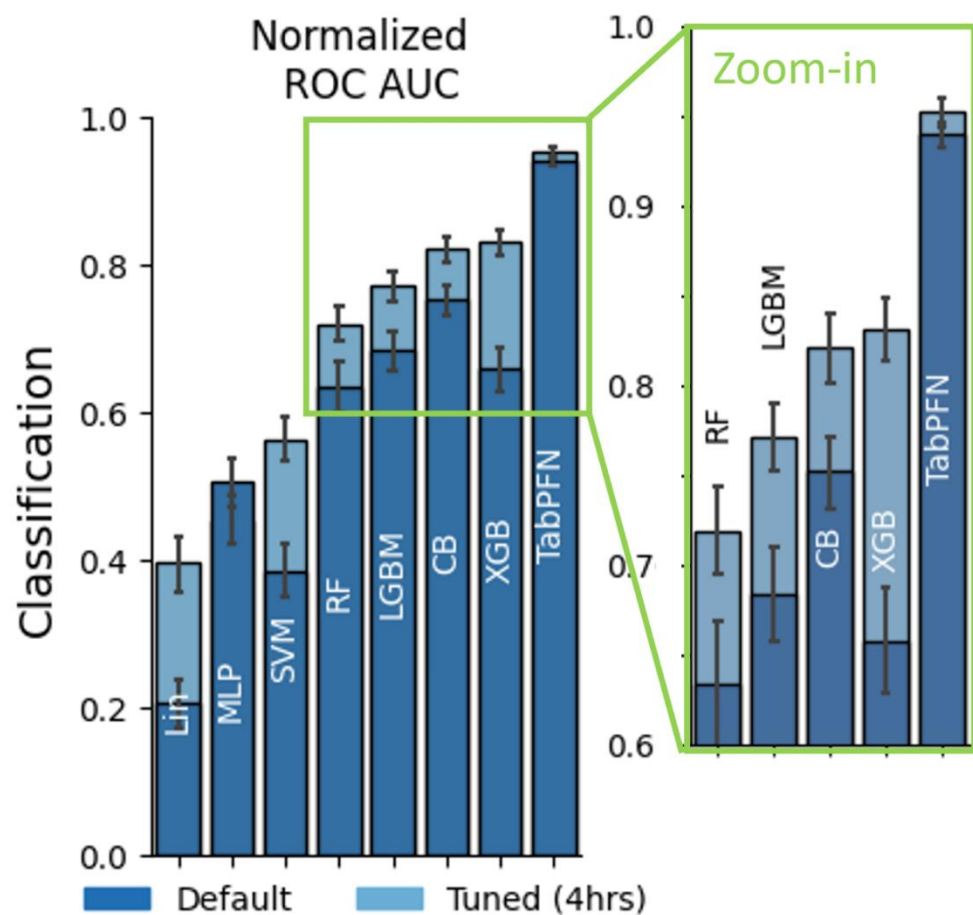

Each node represents one entry in the table.

The vector is transformed to a piece-wise constant (Riemann) distribution with an MLP.

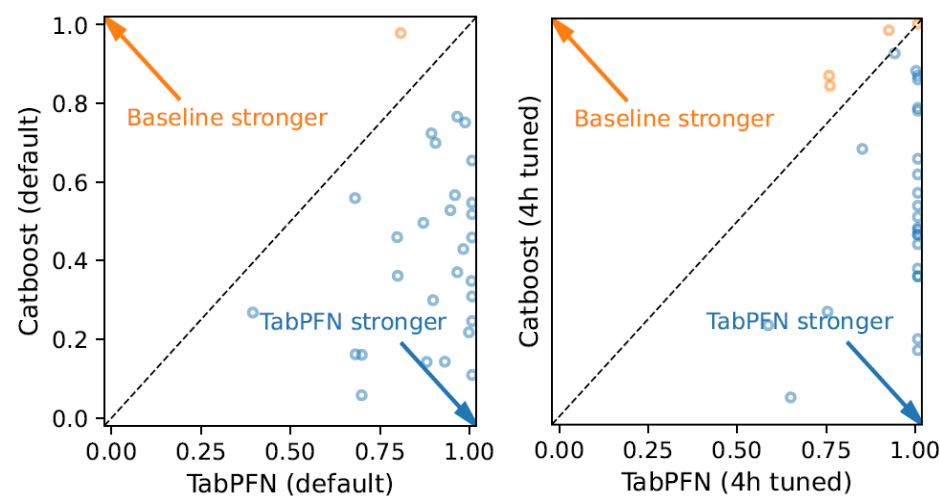

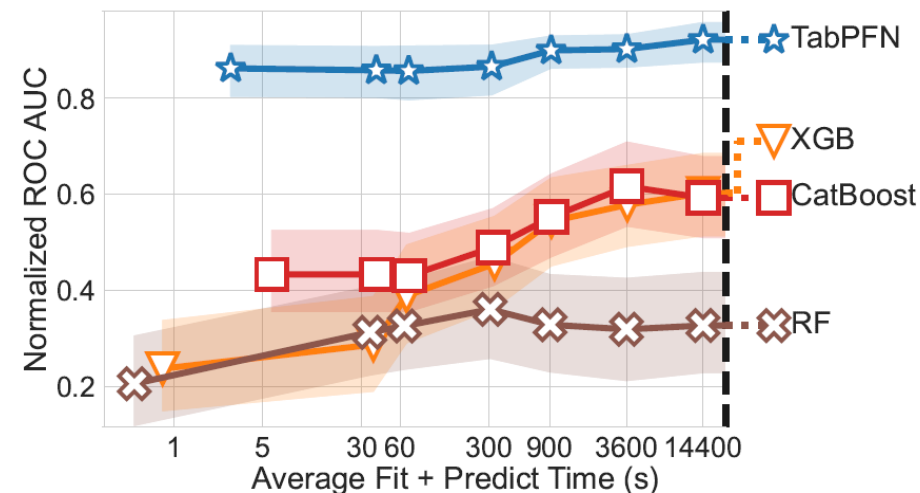

Predicted  $y$  distribution

# Results for Classification

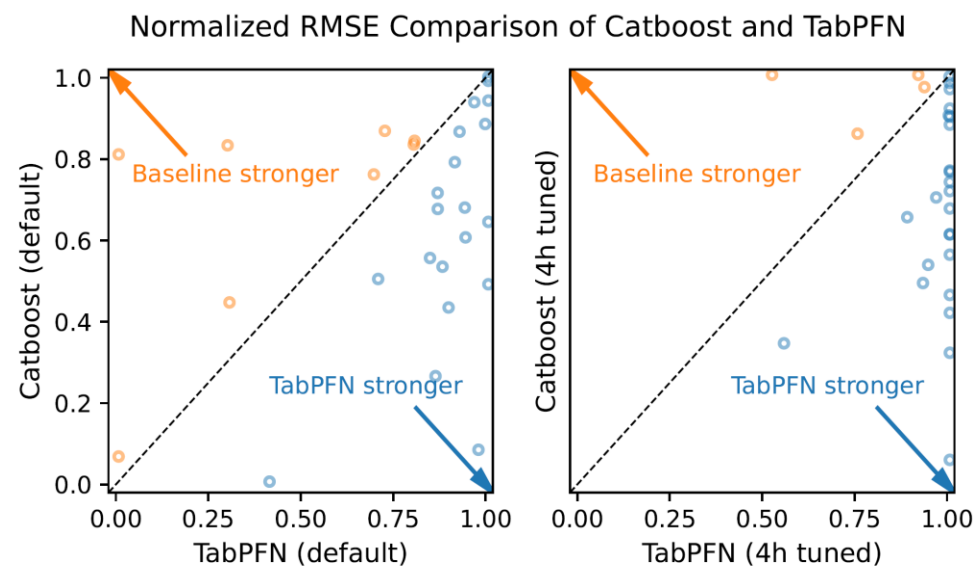

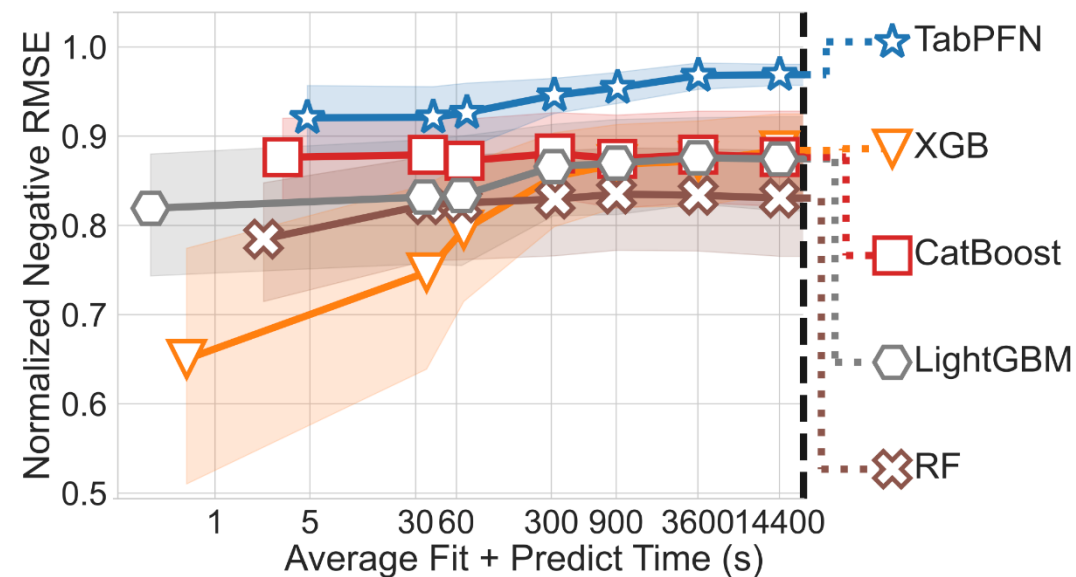

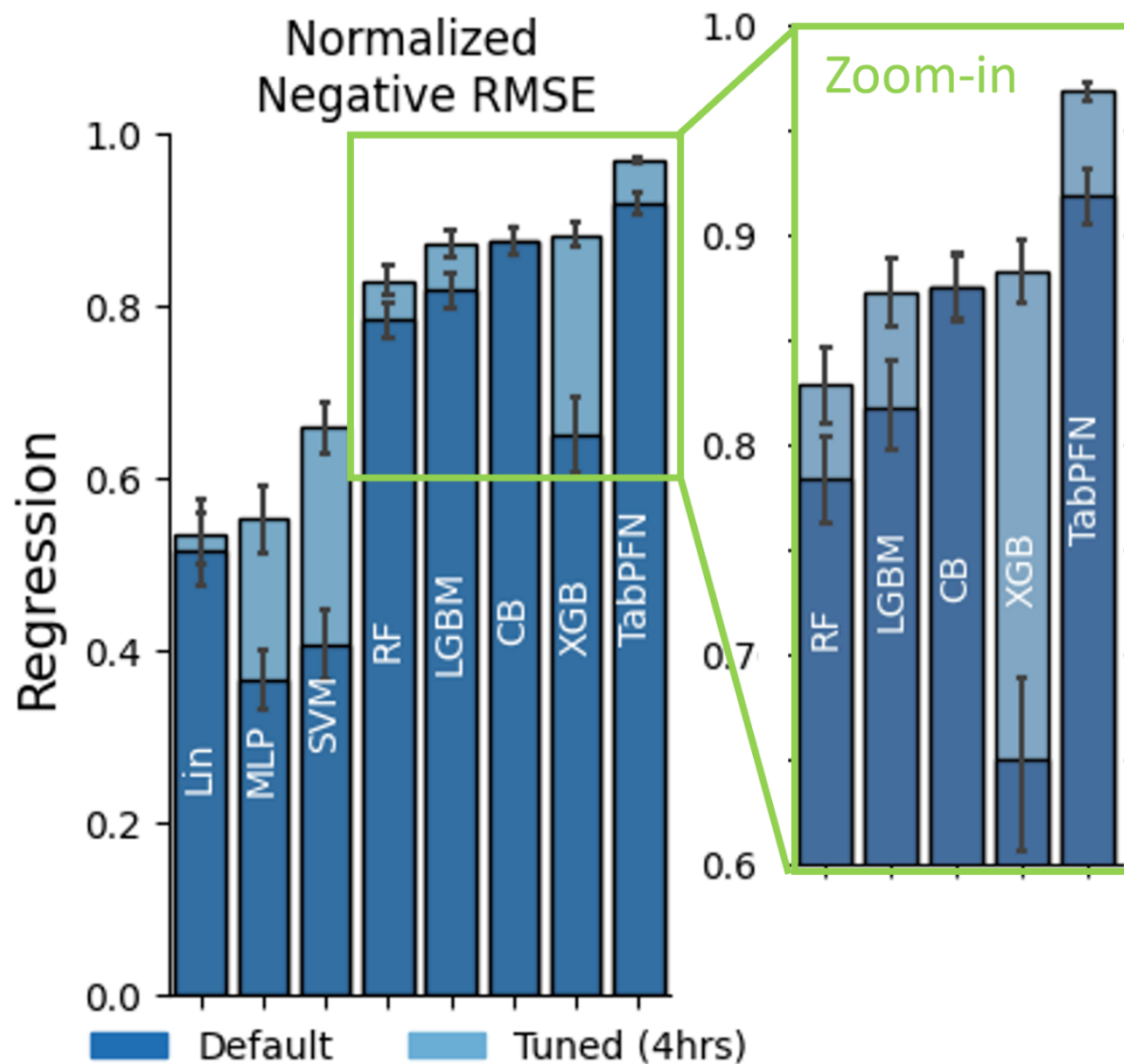

Result across 29 datasets:  
better in 5s than other methods in 4h

Improvements are quite stable across datasets,  
for both default & tuned

# Results for Regression

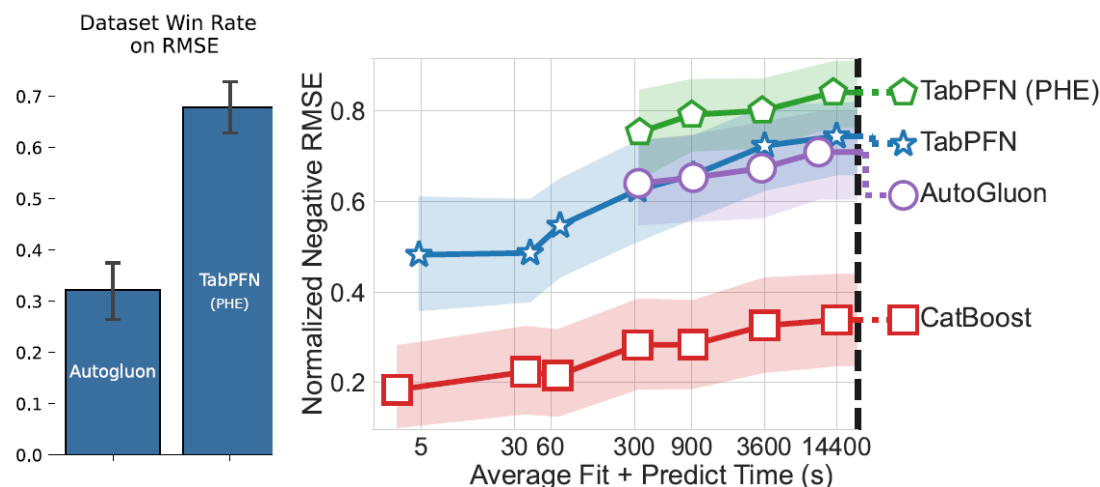

# Comparison to the Leading AutoML Method AutoGluon

- Classification:
  - Even 5s of native TabPFN is better than AutoGluon (4h)
  - TabPFN (PFE) better yet

- Regression:
  - TabPFN similar to AutoGluon
  - TabPFN (PHE) still better
    - 5s matches AutoGluon 4h

# TabPFN is now robust against uninformative features

- Setup: Add 9x uninformative features to actual features
- TabPFN v1 had big problems with uninformative features
  - Neural networks are notoriously bad at handling uninformative features, see MLP performance
- Including the possibility of uninformative features in the prior fixed this

# TabPFN is now robust against missing values

- Setup: subset of datasets with / without missing values
- TabPFN v1 had some problems with missing values
- Including the possibility of missing features in the prior fixed this

# TabPFN is now robust for categorical features

- Setup: subset of datasets with / without categorical features
- TabPFN v1 had problems with categorical features
- Including the possibility of categorical features in the prior fixed this

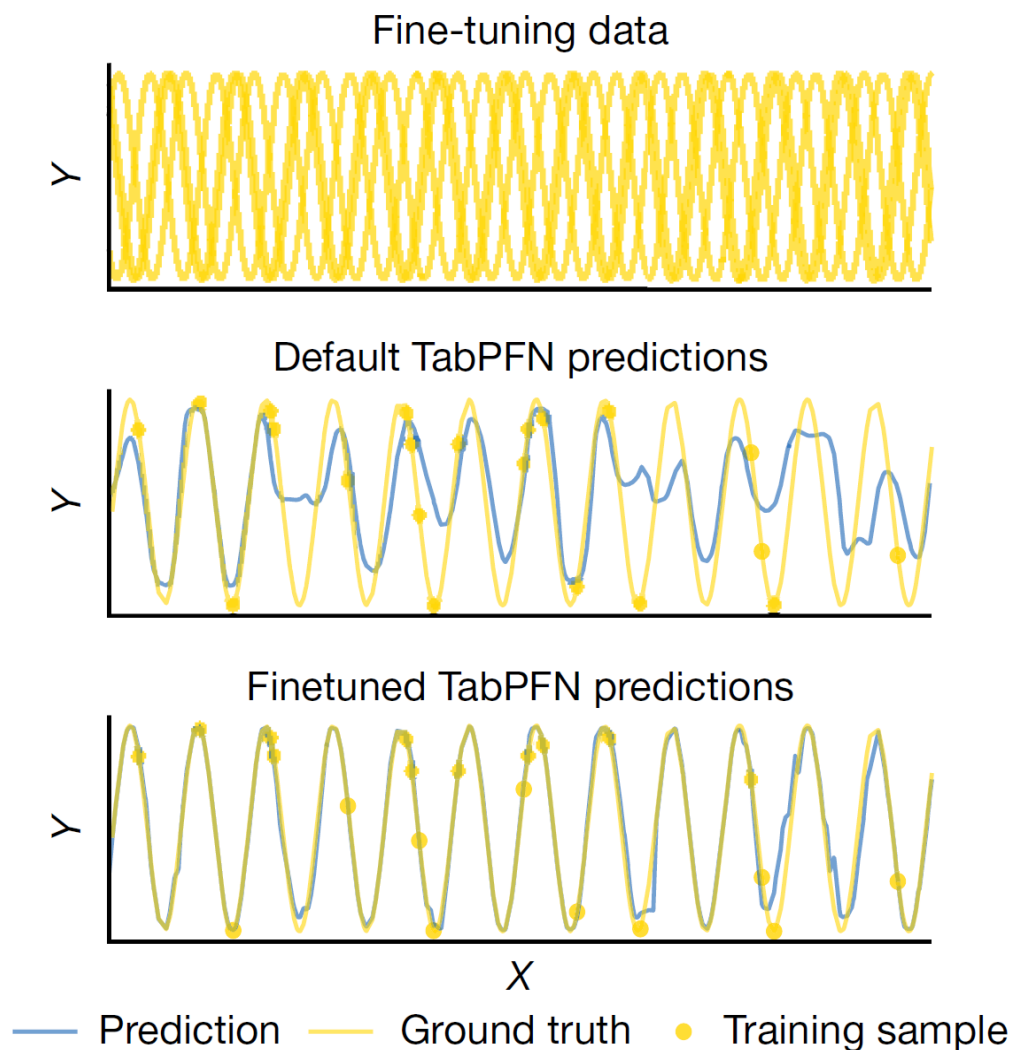

# TabPFN works well with less samples

- TabPFN using 50% of the data ties with CatBoost using 100% of the data

# Finetuning: customizing the model (just like an LLM)

Fine-tuning to toy (sine) functions

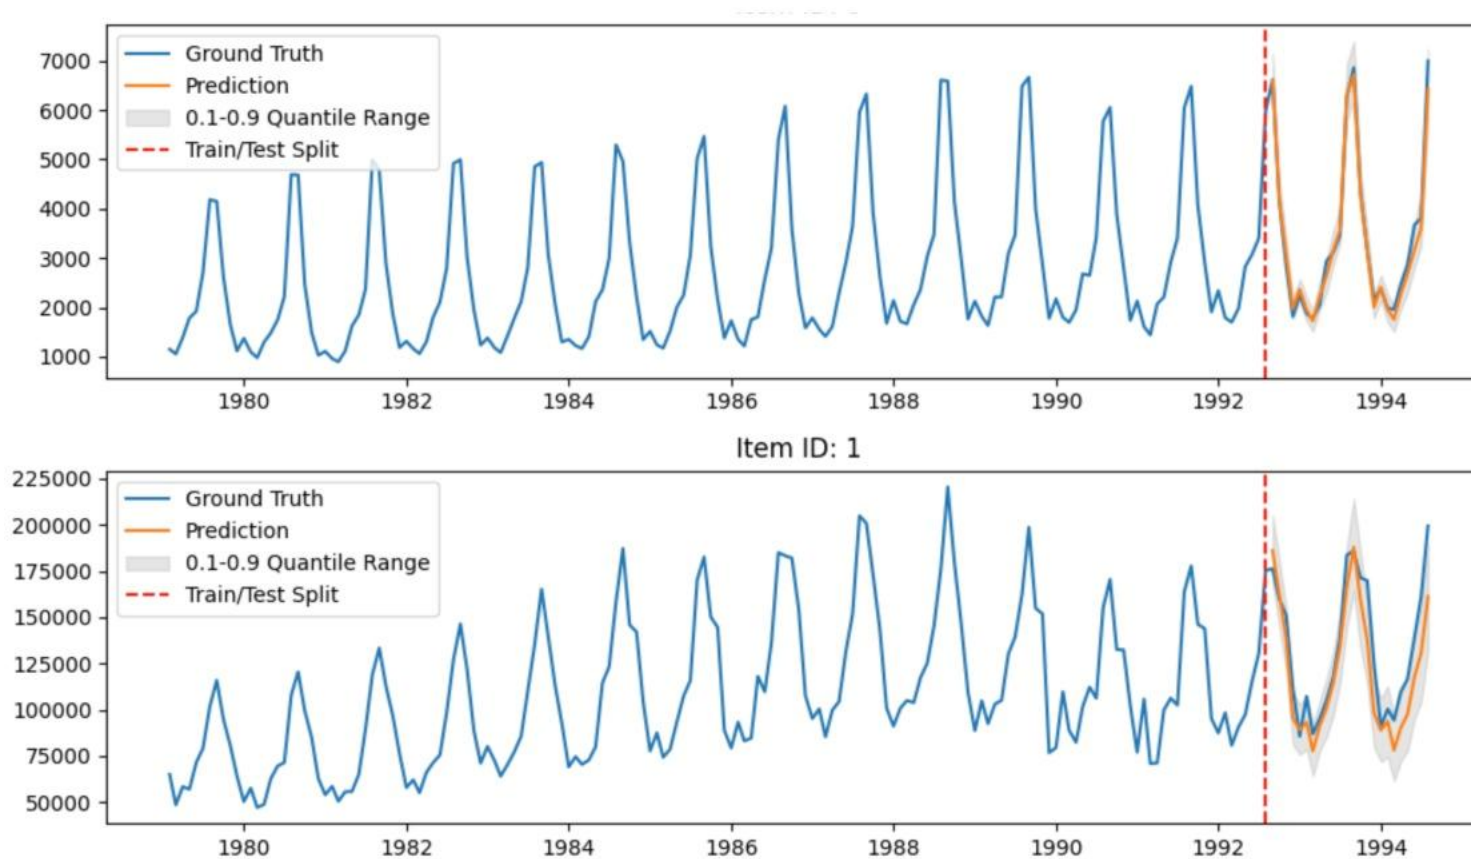

Fine-tuning to (broad collection of) real datasets

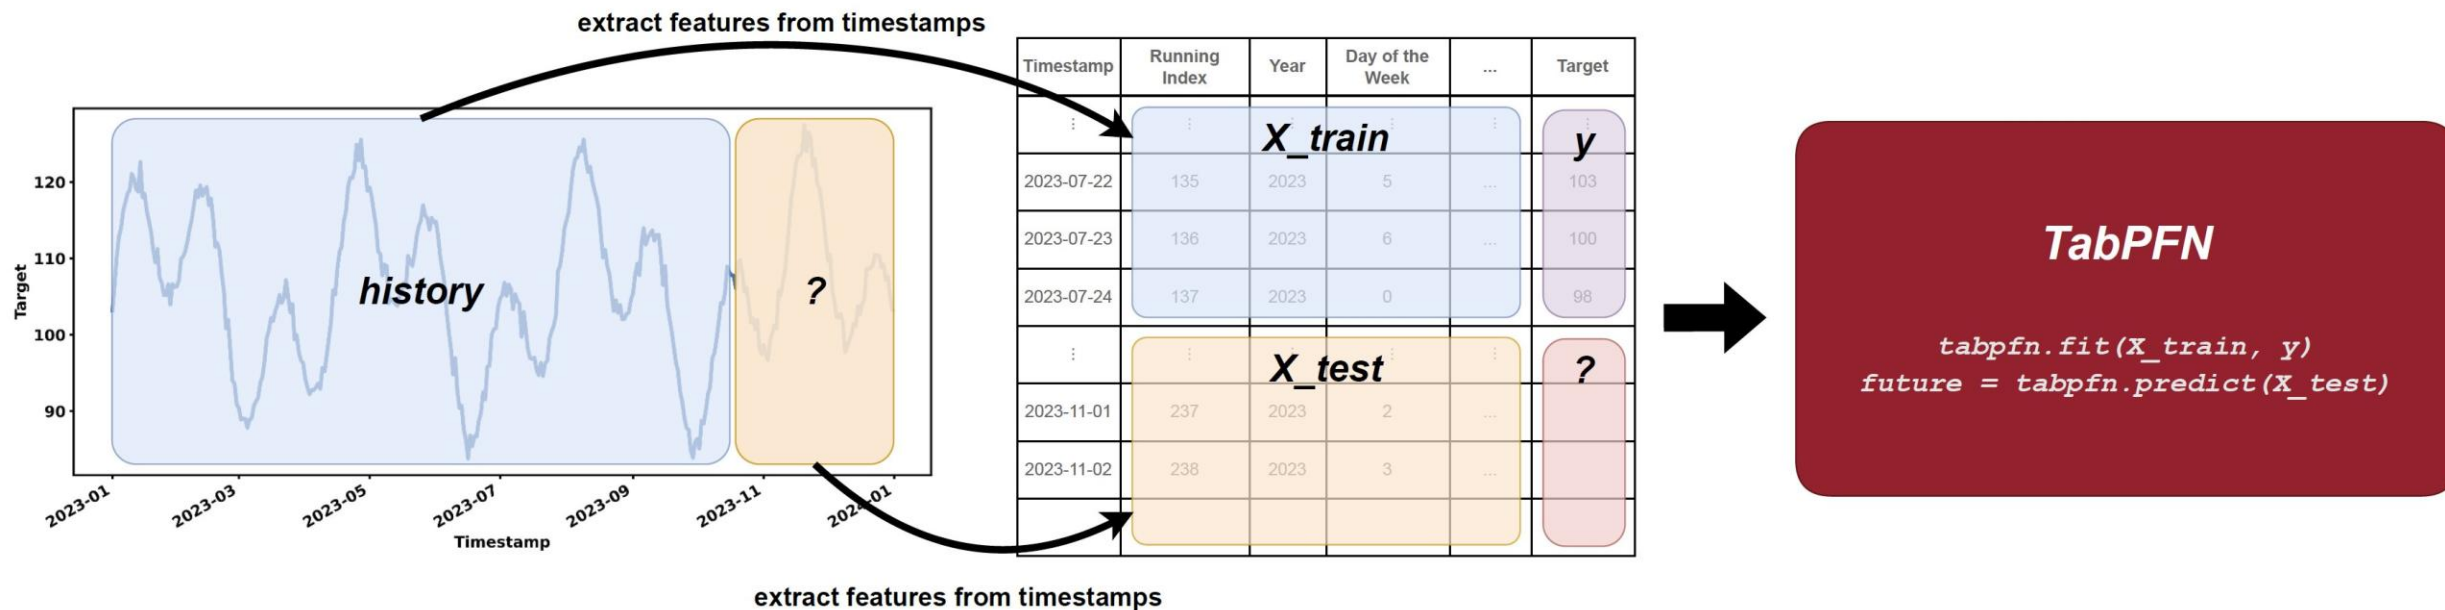

- Motivation
- TabPFN
- TabPFN v2
- ➡ TabPFN for time series: TabPFN-TS
  - Explainability & Fairness

# TabPFN v2 also excels on time series data: TabPFN-TS

# Casting time series forecasting as tabular regression

- Motivation
- TabPFN
- TabPFN v2
- TabPFN for time series: TabPFN-TS

➡ Explainability & Fairness

# Explainability: what effect does each feature have?

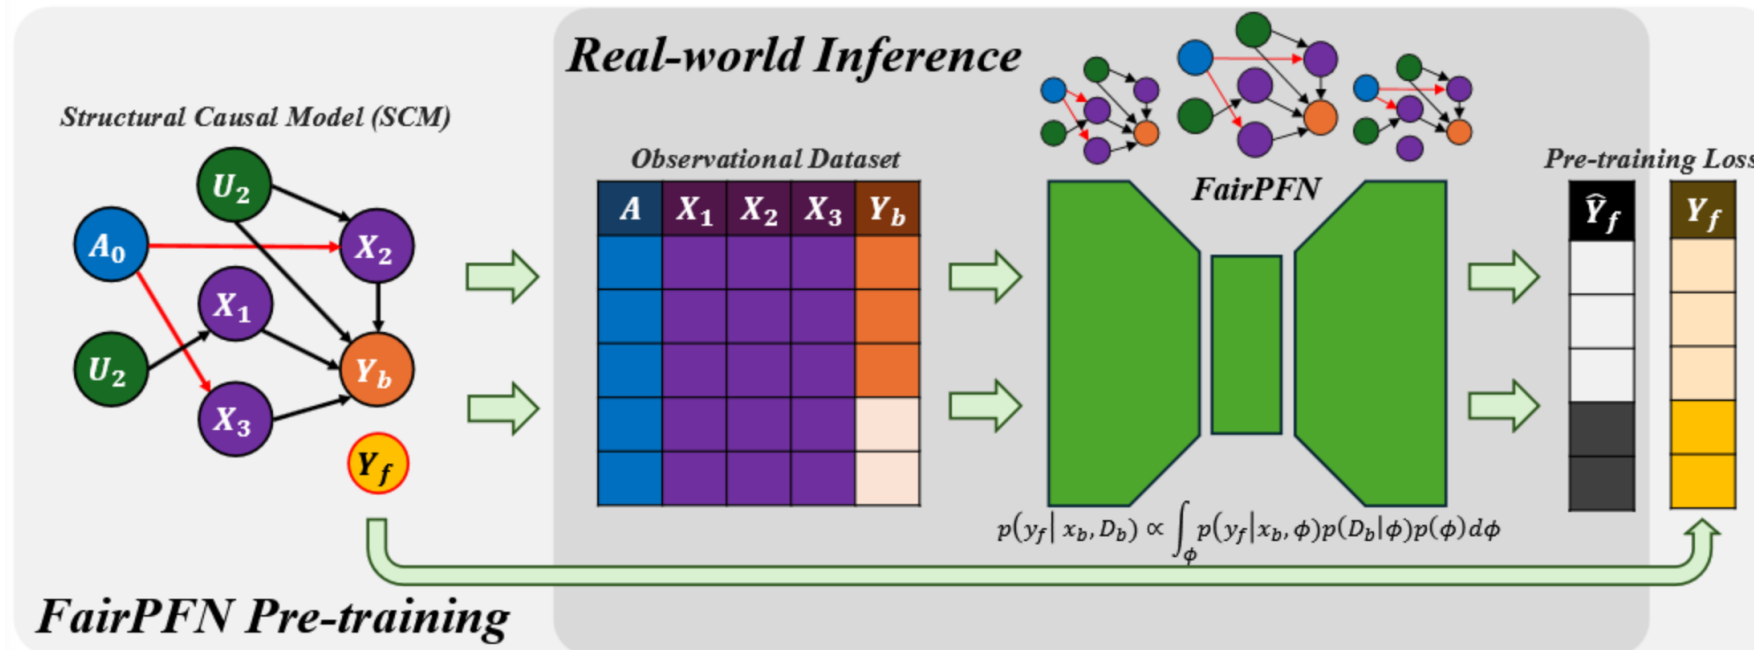

- SHAP analysis yields more reliable results for TabPFN
  - Much better predictions than linear regression
    - captures nonlinear effects
  - Much smoother predictions than boosted trees
    - clearer SHAP patterns

# Counterfactual Fairness with TabPFN

[Robertson et al, ICML 2025]

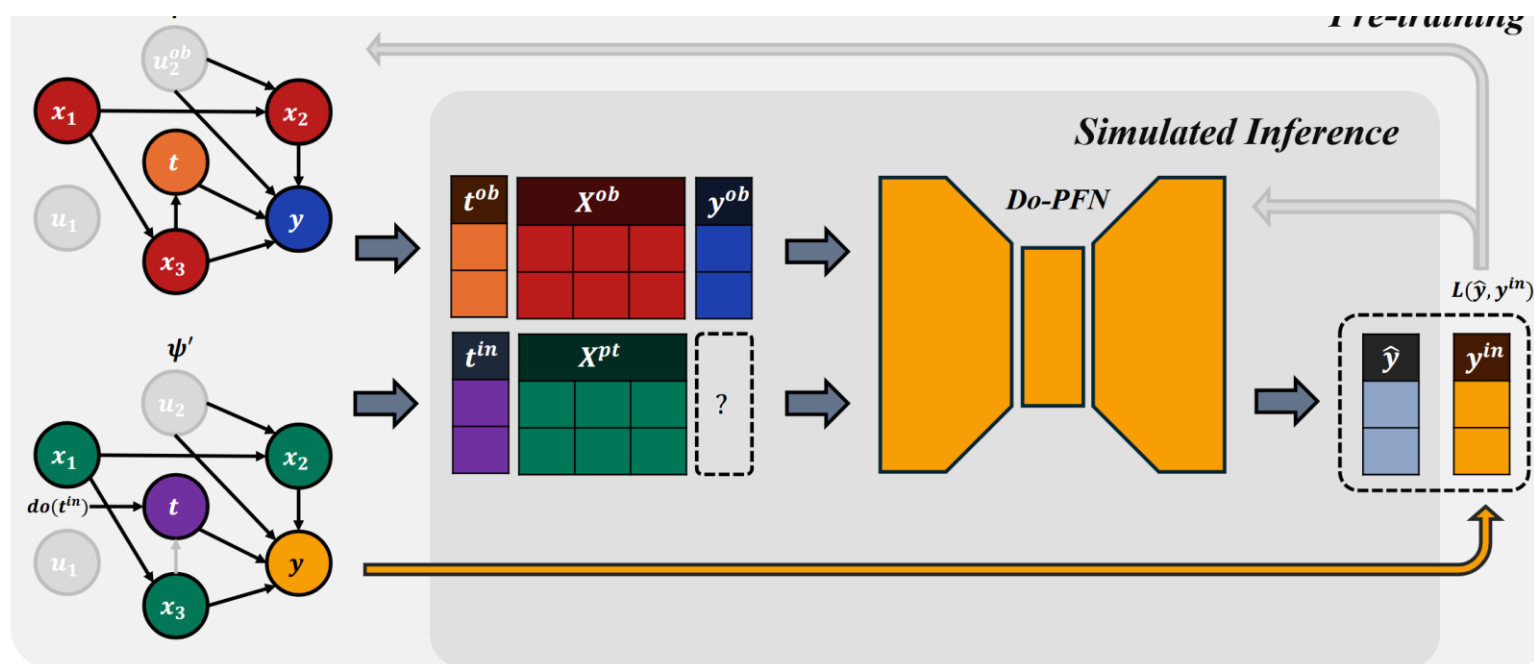

- Counterfactual reasoning: what would the result be IF the protected feature changed?
  - “Holy Grail”: **remove the protected feature’s causal effect on other features**
- Solution with TabPFN’s prior sampling:
  - Generate standard  $X_{\text{biased}}$  and  $y_{\text{biased}}$ , and remove causal effect to generate  $X_{\text{fair}}, Y_{\text{fair}}$
  - Learn to map from  $X_{\text{train, biased}}, y_{\text{train, biased}}, X_{\text{test, biased}}$  to  $y_{\text{test, fair}}$
- Substantially outperforms standard methods

# Interventional predictions with Do-PFN

[Robertson et al, arXiv 2025]

- Interventional reasoning: what will happen to  $y$  if I change  $t$ ?
- Solution with TabPFN's prior sampling:
  - Generate standard observational data  $t^{ob}, X^{ob}$  and  $y^{ob}$ , and interventional  $t^{in}, X^{pt}, y^{in}$
  - Learn to map from  $X^{ob}, y^{ob}, X^{pt}, t^{in}$  to  $y^{in}$
- Substantially outperforms standard methods

- **TabPFN is the new default for small tabular ML**
  - Currently: up to 10k data points, 500 features; scaling up further
  - Unique features compared to previous methods
    - **Faster** (no HPO needed, more interactive data science)
    - Better **peak performance**
    - Works well with **less data**
  - More interpretable
- **Finetuning clearly improves performance**
  - Customization to various use cases
